Before the twentieth century
Rheticus was the greatest calculator
of mathematical tables who ever lived.
R. C. Archibald [7]

1 Rheticus (1514–1574)

Georg Joachim was born in 1514 in Feldkirch (Austria) in what was formerly the Roman province of Raetia, from which the name Rheticus is derived. His father was a doctor.[1] After studying in Zurich from 1528 to 1532, Rheticus went to Wittenberg to complete his education. Wittenberg was then the center of the sciences. He obtained his doctorate in 1536, went to Nuremberg and Tübingen, then was called back to Wittenberg as professor of mathematics in 1536, along with Erasmus Reinhold. In 1539, he went to Frauenburg in order to assist Copernicus and pushed him to publish the details of his theory.

The first account of the Copernican system was not published by Copernicus, but in Rheticus' *Narratio prima* in 1540 [58, 70, 12, 10, 11, 13, 14]. In fact, Rheticus was more zealous than Copernicus, insisting on the physical truth of the motion of the earth. Rheticus' books were condemned by the catholic church in 1550 and put on the *Index Expurgatorius*, and this condemnation applied to his works on trigonometry. As observed by De Morgan, this severity was not so remarkable, if we remember that Rheticus held the chair of mathematics at Wittenberg, where Luther had taught theology [27, p. 518].

Rheticus resumed his teaching in Wittenberg in 1541 and in 1542, Copernicus' *De lateribus et angulis triangulorum* [22] was published in Wittenberg. This short treatise on trigonometry contains a table of sines for every minute of the quadrant and for a radius of 10^7. The sines were given to seven places, over 36 pages, with the first half of five consecutive degrees on one page, and the next half on the following page. The table also gave the cosines, although this name did not exist then. It was only introduced by Gunter in 1620 [41]. The sine headings were on the top and left column, and the cosine headings on the bottom and right column. Finally, this table had a column for the differences. This table was certainly published under Rheticus' pressure, but its contents was taken from Regiomontanus' works.

Copernicus' *De Revolutionibus* (1543), whose printing was partly overseen by Rheticus, contained the same chapter on trigonometry, but with a simpler table [23, book 1, chapter 12, ff. 15–19]. The sines were only given every $10'$ and for a radius of 100000. The values were also taken from Regiomontanus' works.

In 1542, Rheticus went to Nuremberg and Philip Melanchton [84] then helped him to obtain a position at Leipzig University where he remained from 1542 to 1551. Rheticus had to leave Leipzig after being accused of homosexual conduct and went to Prague in 1551. He gave up his academic career and completed his medicine studies. He settled in Cracow in 1554 where he practiced medicine. Cracow was located on the same meridian as Frauenburg and Rheticus had a 15-meter obelisk erected near the city for astronomical purposes which were never completed [19, p. 9], [88]. Rheticus died during a visit in Košice, now in Slovakia, in 1574.

[1] For extensive biographies of Rheticus, see Burmeister [18, 19], Kraai [53], Danielson [25], and Schöbi-Fink [76].

2 Rheticus' first table (1551)

Rheticus published his first trigonometric canon, the *Canon doctrinæ triangulorum*, in 1551 in Leipzig [59]. It gave the six trigonometric functions at intervals of $10'$, semi-quadrantically arranged. Each function was given to 7 places, or more exactly as integers for a radius of 10^7. This is a very rare table, and it was practically unknown when De Morgan happened to find a copy of it in the 1840s [28, 27].

Rheticus was the first to provide a uniform treatment of the six trigonometric functions. He was in particular the first to publish a table of secants.[2] Rheticus only computed two thirds of his table. The table of sines was taken from Regiomontanus [40, p. 152], but the tangents and secants were recomputed from the sines [40, p. 193]. Rheticus had therefore to compute about 1080 ratios ($90 \times 6 \times 2$).

He did not consider angles in circles, but triangles of which one of the side was constant, and he gave the lengths of the other sides as a function of the angle at the center. The name of "sine" was not used by Rheticus, nor those of tangent and secant, the latter two having not yet been introduced.[3] The sides were called "base," "perpendicular," and "hypothenuse." The tables span 14 pages, with 7 degrees on each double page. The last double page is not totally filled, with only the degrees 42 to 44. Each double page is split in three groups of two columns. Each group gives the values of two functions and their differences. The first group (hypothenuse = 10^7) gives the sines and cosines, with their differences. The second group (base = 10^7) gives the secants and the tangents. And the third group (perpendicular = 10^7) gives the cosecants and the cotangents. The structure of the table was first described by De Morgan [28, 27].

The 1551 canon has been reprinted in 1565 in Basel [40, p. 185].[4]

3 The quest for accuracy: the *Opus palatinum*

In fact, Rheticus went a lot beyond providing a uniform treatment of trigonometric functions. For him, the main cause of errors in observations was not so much the inaccuracy of instruments, but the errors in the trigonometric tables used for the computations. He therefore resolved to recompute these tables much more accurately. The *Canon doctrinæ triangulorum* of 1551 was only a first step in that endeavour.

Rheticus took the radius 10^{10} and computed the trigonometric functions every 10 seconds of the quadrant. He was the first to compute sine tables with intervals smaller than one minute [35, p. 98]. Rheticus had computers work for him for twelve years,[5] but his great tables were not published to his lifetime.[6] The cost of the tablemaking up to 1568

[2] In 1819, Delambre, unaware of Rheticus' 1551 table, still wrote that Viète was the first to put together all these functions in 1579 [30, p. 456].

[3] It was Thomas Fincke who in 1583 first used the names "tangent" and "secant" [32, 29].

[4] De Morgan wrote earlier that it had been reprinted in 1580 [27, p. 521].

[5] The source of this information is the letter Rheticus wrote in 1568 to Petrus Ramus [16, p. 56]. This information was repeated by other authors [35, p. 92], and the letter is reproduced in [37, p. 228] and translated in German in [18, vol. 3, pp. 187–190]. See also [19, p. 9]. Some authors have added that Rheticus had five or six computers working for him, but I do not know what is the source of this information [39, p. 45]. The computers were funded by Emperor Maximilian II [71].

[6] From the available information, it therefore seems that Rheticus had started to work on the table around 1556. It isn't clear if much work was done between the time of the letter and Rheticus' death.

was 4400 Gulden, representing almost 50 times Rheticus' annual salary in Wittenberg [19, pp. 9–10]. He died when the tables of cosecants and cotangents were being worked on. Towards the end of Rheticus' life, Lucius Valentinus Otho (ca. 1545–1603) came to assist Rheticus and promised him to complete the work, this event paralleling Rheticus' encounter with Copernicus. According to Curtze and Burmeister, Otho's visit was driven by Johannes Praetorius who was then professor of mathematics in Wittenberg [24], but according to Hilfstein, based on Otho's preface of the *Opus palatinum*, Otho merely got excited by Rheticus' 1551 table and decided to pay its author a visit [45].

The complete canon was however only published in 1596, under the title *Opus palatinum* [60], for Otho was then mathematician to the electoral prince Palatine Frederick IV [15, pp. 17–20]. Each trigonometric function of the canon was given to 10 places (radius 10^{10}), every 10 seconds of the quadrant. The whole *Opus palatinum* was about 1500 pages long, of which more than 700 were tables, and contained everything related to trigonometric tables.[7] Descriptions of the *Opus palatinum* were given by Delambre [31, volume 2, pp. 1–35], and Archibald [7, p. 556].

The manuscript of the main table of the *Opus palatinum* is also still extant and kept at the British Library (Harley MS 1720).[8] It is a beautiful work, written with values in black and differences in red. The printed version of the *Opus palatinum* does not exhibit any color, but perhaps some colors were planned, paralleling Rheticus' *Canon doctrinæ triangulorum* [59] or Viète's *Canon mathematicus* [80] (1579) of which Otho was probably aware.

Rheticus' work was so complete and went much beyond everything that had been computed before, that it was legitimate, like Kepler, to think that these sines had been computed once and for all, and that there was no need to go further [50, p. 506].

As observed by van Brummelen, the tables in the *Opus palatinum* were to be the foundation of all great calculations in astronomy and other fields for several centuries [78, p. 275].

But not all of Rheticus' work was published in the *Opus palatinum*. Rheticus had for instance computed a table of sines to 15 places (radius 10^{15}), with first, second and third differences for every 10 seconds of the quadrant, and for every second in the first and last degrees (with first and second differences). These tables were eventually published by Pitiscus in his *Thesaurus mathematicus* in 1613 [57]. It is possible that Rheticus had plans to compute the whole canon to this accuracy.

Rheticus' papers also contained other fragmentary tables which are mentioned in Pitiscus' preface [35, pp. 89–90].

4 The making of the *Opus palatinum*

Rheticus has first computed the sines of a number of principal arcs, such as 30°, 36°, etc., all to 15 decimal places.[9] He then applied bisection and found other sines, down to 45′.

Curtze, for instance, considers that Rheticus' tables had been computed by 1567 [24, p. 496].

[7] A copy of the *Opus palatinum* is available through the university of Dresden: `http://digital.slub-dresden.de/werkansicht/dlf/12516/1/`.

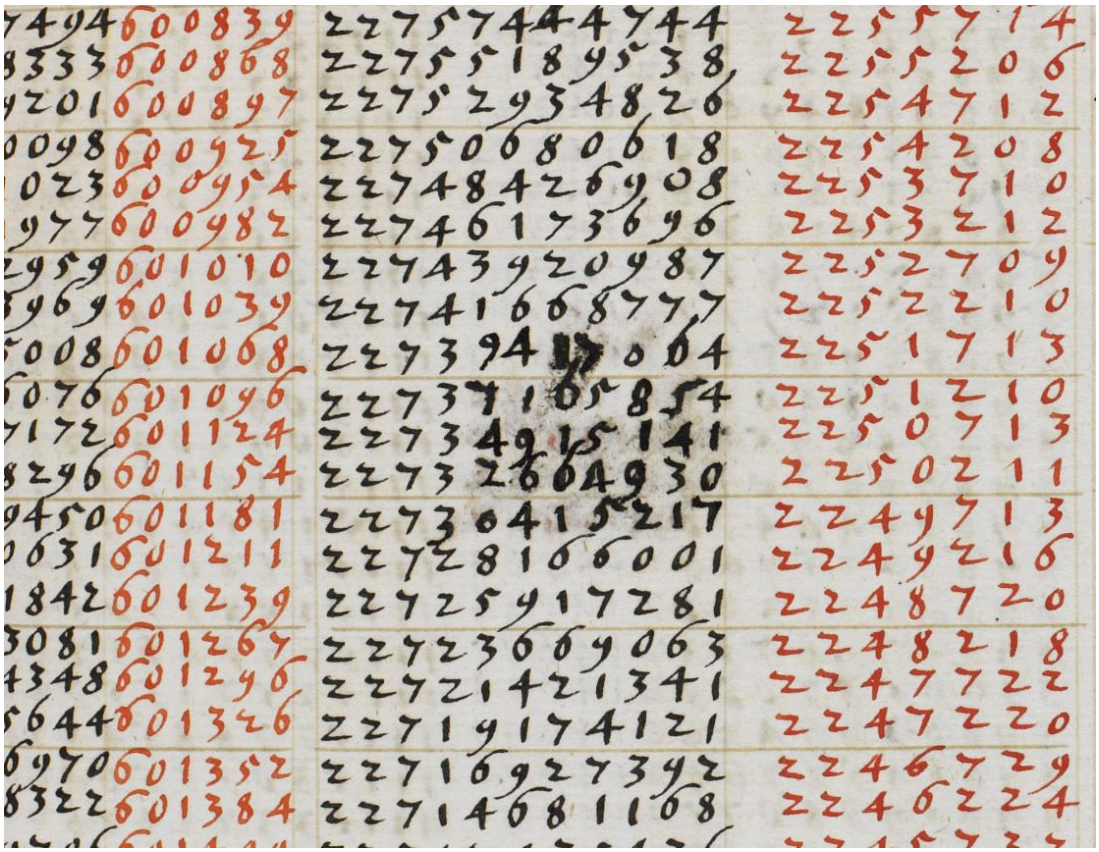

Figure 3: An excerpt of Otho's manuscript (page I-315) showing some corrected figures (by permission of the British Library, Harley MS 1720).

Then, using the results on the sum and differences of arcs, Rheticus obtained the sines of all arcs up to 90°, by steps of 1°30′. He then obtained the sines of all arcs up to 90°, by steps of 45′ [60, p. 43]. By bisecting 43 times, he obtained the sine of

$$45 \times \frac{60^7}{2^{43}}^{\text{VIII}} = 14.3212\ldots^{\text{VIII}} = 14^{\text{VIII}}19^{\text{IX}}\ldots \text{ [60, p. 45]}$$

Rheticus stopped here, because it is the smallest value greater than 10^{-15} in this series.

Rheticus then considered the sine of $55°\frac{1}{2}$ which he had computed, and by bisecting it 14 times, he obtained an angle which when subtracted to the 6th bisection of 45′ was nearly 30″. Finally, by assuming that $\frac{\sin x}{\sin y} \approx \frac{x}{y}$ for small x and y, Rheticus obtained an approximation of the sine of 30″ [78, p. 278]. His value was only correct to 12 rounded decimal places, because there was an error in the bisection of $55°\frac{1}{2}$.

Then Rheticus obtained an approximation for the sine of 5″ and finally for the sines of 10″, 20″, 30″, 40″, and 50″. Using these sines, Rheticus deduced the whole canon.

The layout of the table is similar to the one used in 1551 in the *Canon doctrinæ triangulorum* [59].[10] Rheticus does not use the names sines, cosines, etc., but uses the names of sides in a triangle. The table is divided in three columns spanning two pages. In the first column, the hypothenuse is made constant to 10^{10} and the "perpendicular" and "base" are our sine and cosine. In the middle column, the base is made equal to 10^{10} and the hypothenuse and perpendicular are our secant and tangent. In the last case, the perpendicular is made constant to 10^{10} and the hypothenuse and base are our cosecant and cotangent.

The heading of the tables means "Canon of the doctrine of triangles in which in a plane triangle with right angle 10^{10} parts are taken for 1) the (side) subtending the right angle, 2) the greatest of the two sides including the right angle, and 3) the smallest of the two sides including the right angle" [15, p. 13].

The detailed structure of the volume of tables in the *Opus palatinum* is the following:[11]

1. a first part has pages numbered 2–541 and gives all six functions with 10′ spanning two pages ($45 \times 6 \times 2 = 540$) and a radius of 10^{10};

2. a second part has pages numbered 2–181 and gives only the third group of columns (cosecants and cotangents), again with 10′ spanning two pages ($\frac{540}{3} = 180$) but with a radius of 10^7.

The second part is normally redundant and is an earlier table computed by Rheticus, but it may be useful for comparison of the values.

[10] De Morgan considers that the semi-quadrantal arrangement of the tables finds its roots in Rheticus' three cases of triangles. In the first case, the greatest side of the triangle is the cosine, and the smallest side is the sine. The divisions would not have been the same if Rheticus had given the sines for the whole quadrant. Rheticus' arrangement led to consider the duality of sine and cosine, tangent and cotangent, and secant and cosecant [27, p. 523–524].

[11] For early descriptions of these tables, see Lalande (who gave an incomplete description) in 1771 [26], which was corrected by Bernoulli [15].

5 The errors in the original *Opus palatinum*

The *Opus palatinum* unfortunately contained an important error. As told by Lardner [54, p. 280], after Rheticus and Otho's work had been in circulation in every part of Europe, it was found that the beginnings of the tables of cotangents and cosecants were corrupted by a very important error. Adrianus Romanus (Adriaan van Roomen)[12] (1561–1615) was the first to notice the flaw [16]. In order to examine the accuracy of the table, Romanus made use of the formula

$$\sec a + \tan a = \tan\left(\frac{a}{2} + 45^\circ\right).$$

For instance, in the first cotangent, the last nine places were incorrect. Rheticus had

$$\begin{aligned}\cot 10'' &= 20626.4670574694\\ \csc 10'' &= 20626.4670327177,\end{aligned}$$

the correct values being

$$\begin{aligned}\cot 10'' &= 20626.48060854917\ldots\\ \csc 10'' &= 20626.48063278986\ldots.\end{aligned}$$

But the way in which the values were computed made this error gradually vanish. The error eventually vanished in the 86th page.

Romanus did not only find the error, but he also went into a deeper error analysis, establishing rules about the number of necessary extra decimals for a correct computation [16, p. 59]. He understood that Rheticus had not computed the sines with enough digits to ensure an accuracy of 10 places in the last tangents and secants.

When the errors were found, Otho was ill and no longer capable of correcting them. It was Bartholomaeus Pitiscus (1561–1613) [6] who undertook the recomputation of the 86 incorrect pages, probably taking into account Romanus' analysis. This apparently only happened after the death of Lucius Valentinus Otho in 1603, as Pitiscus first tried to obtain a manuscript copy of Rheticus' sine table to 15 decimal places, thinking that Rheticus' unpublished tables might help for the correction.

Either by his own analysis or as a consequence of Romanus' analysis, Pitiscus understood that Rheticus' computations were not sufficient and he decided to compute new tables.

Pitiscus first recomputed to twenty decimal places all the sines up to 7° and all the tangents and secants between 83° and 90° to eleven decimal places. 86 pages of the *Opus palatinum* were reprinted incorporating Pitiscus' corrections. A new edition, with a new

[12] Romanus was one of the mathematicians who had embarked on the calculation of trigonometric tables. In 1593, he mentioned in particular Rheticus' letter from 1568, and he was aware of the planned completion of the *Opus palatinum* [16, pp. 55–56]. Romanus' own plans were to compute a sine table for the radius 10^{16}, but he did not have calculators to second him. Romanus was probably one of the first persons to buy the *Opus palatinum*, as he eagerly awaited its publication. As he was corresponding with Clavius, he also sent him a copy, and they exchanged about the accuracy of the tables. The correspondence with Clavius also reveals that Christoph Grienberger [39, p. 45] was preparing a table of sines, but this table was never published.

title page, was reissued in 1607.[13] Six years later, Pitiscus published a corrected version of Rheticus' sine table in his *Thesaurus mathematicus* [57, 67].

After their publication, the *Opus palatinum* or the *Thesaurus mathematicus* became the *de facto* trigonometric standard and were used by Vlacq to compute his trigonometric tables in 1628 and 1633 [81, 82]. A number of other tables were derived from the *Opus palatinum*, see for instance Archibald [5].

In 1897, Wilhelm Jordan (1842–1899) published sine and cosine tables excerpted from the *Opus palatinum*, with the title *Opus Palatinum : Sinus- u. Cosinus-Tafeln von* $10''$ *zu* $10''$ [48]. This was not, however, a reprint of the *Opus palatinum*.[14] For errors in this edition as well as in others related to Rheticus' tables, see Fletcher *et al.* [33].

Pitiscus' *Thesaurus mathematicus* was published the year before Napier's logarithms. Logarithms were going to change the way computations were done, and natural tables of sines were less needed than accurate tables of logarithms. This may explain why Rheticus and Pitiscus' tables remained unsuperseded until Henri Andoyer's 17-place[15] tables were published in 1915–1918 [2].

6 Structure of the tables and recomputation

We have reproduced the two canons of the *Opus palatinum*, and we have retained the page numbers of the original version (2–541 and 2–181) for easy reference.

The tables were recomputed using the GNU `mpfr` multiple-precision floating-point library developed at INRIA [34], and give the exact values. The comparison of our table and Rheticus' will therefore immediately show where Rheticus' tables contain errors.

We have added a few values which had been omitted by Rheticus and Otho. The first table gave no values for $0°$ and therefore omitted three differences on the subsequent line. The second table gave no values for the cosecant and cotangent of $0°$, as well as for the relevant differences. We have supplied all the correct values.

[13] The corrected edition is very rare, but can easily be identified without looking at the actual values, first because the new pages are of a lower paper quality, and then as there is a small layout error at the bottom of page 7 of the corrected copies, where the words *basis* and *hypothenusa* have been interchanged. Copies of the 1607 edition seem to be located at Göttingen and Jena. In 1949, Archibald had also located three copies and there are probably a few more [7, pp. 558–559]. Prony bought one copy which is now in the library of the *Ponts et chaussées*, Fol. 415, see [61, 62]. Prony studied Pitiscus' corrections in detail [61, 62]. Some drafts of Prony's analysis are kept at the library of the *Ponts et chaussées*, Ms. 1745. See also Archibald's notice on Pitiscus [6, pp. 394–396].

[14] At least five more editions were published in 1913, 1923, 1925, 1929, and 1936. The sines and cosines were only given to seven places, with differences, with 10 minutes per page, from $0°$ to $45°$, like in the *Opus palatinum*. The angles are also given in the centesimal division. In the five pages preface, Jordan announced his plans for the inclusion of tangents, cotangents, secants and cosecants in a second edition, but Jordan's death has probably canceled these plans. These tables would presumably also have been derived from the *Opus palatinum*. Jordan cites Regiomontanus, Rheticus, Otho and Pitiscus, but Regiomontanus' work was actually not used. Jordan seems to have translated in German the introduction of the *Opus palatinum*, and perhaps planned to publish it in the future, what apparently never happened.

[15] van Brummelen mistakenly writes that Andoyer's tables are 20-place tables, but only a small part of the tables are to 20 places. The general tables are to 17 places.

References

The following list covers the most important references[16] related to Rheticus' tables. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. We have added notes about the contents of the articles in certain cases.

[16] **Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.
